Using claude.ai

Prompt:

Write a python3 script which opens a raw disk, writes a random pattern to all bytes on the disk and then reads all bytes and verifies that they are correct.

Error - unterminated string

A terminal window titled "Claude — -zsh — 85x7" with standard macOS window controls (red, yellow, green buttons). The terminal shows a command prompt where a script is executed. The script file is located at `"/Volumes/Enigma/DevWork/MacSysAdmin2025/Claude/./cert_disk"`. On line 142, the code is `base_device = re.sub(r'\d+`. The `r'` is highlighted in red, and a red caret points to it. Below the code, a `SyntaxError` message is displayed: `SyntaxError: unterminated string literal (detected at line 142)`. The prompt `standing@Fika Claude %` is shown at the bottom with a cursor.

```
[standing@Fika Claude % ./cert_disk /dev/rdisk4  
File "/Volumes/Enigma/DevWork/MacSysAdmin2025/Claude/./cert_disk", line 142  
    base_device = re.sub(r'\d+  
                          ^  
SyntaxError: unterminated string literal (detected at line 142)  
standing@Fika Claude %
```

```
141  
142         base_device = re.sub(r'\d+  
143
```

Error - missing “#!” string

A terminal window titled "Claude — -zsh — 85x15" with standard macOS window controls (red, yellow, green buttons). The terminal shows the execution of a script `./cert_disk /dev/rdisk4`. The output consists of 13 lines of error messages. Lines 1-5 and 7-10 report "import: command not found" for `import` statements. Lines 6 and 9 report "from: command not found" for `from` statements. Line 13 reports a "syntax error near unexpected token '('". The prompt returns to `standing@Fika Claude %`.

```
[standing@Fika Claude % ./cert_disk /dev/rdisk4  
./cert_disk: line 1: import: command not found  
./cert_disk: line 2: import: command not found  
./cert_disk: line 3: import: command not found  
./cert_disk: line 4: import: command not found  
./cert_disk: line 5: import: command not found  
./cert_disk: line 6: from: command not found  
./cert_disk: line 7: import: command not found  
./cert_disk: line 8: import: command not found  
./cert_disk: line 9: from: command not found  
./cert_disk: line 10: import: command not found  
./cert_disk: line 13: syntax error near unexpected token '('  
./cert_disk: line 13: `def get_disk_size(disk_path):'  
standing@Fika Claude %
```

```
1 import os  
2 import sys  
3 import random
```

Error - can't detect disk size

A terminal window titled "Claude — -zsh — 85x5" with standard macOS window controls (red, yellow, green buttons). The terminal output shows a command to run a script on a raw disk, followed by an error message indicating that all size detection methods failed.

```
[standing@Fika Claude % sudo ./cert_disk /dev/rdisk4  
Auto-detecting size of: /dev/rdisk4  
All size detection methods failed  
Could not auto-detect size for /dev/rdisk4  
standing@Fika Claude %
```

A terminal window showing the output of the 'diskutil info disk4' command. The output lists various disk attributes. The 'Disk Size' field is highlighted with a white rounded rectangle. The size is listed as 960.2 GB.

```
[standing@Fika Claude % diskutil info disk4  
Device Identifier:          disk4  
Device Node:                /dev/disk4  
Whole:                      Yes  
Part of Whole:              disk4  
:  
Disk Size:                  960.2 GB (960197124096 Bytes) (exactly 1875385008 512-Byte-Units)  
:  
:
```

“Total Size” = macOS 10.12 and earlier, “Disk Size” macOS 10.13 and later

Other Errors

- **Does not accept more than one disk**
- **Poor performance, 3 MB/s**
- **Poor performance, 140 MB/s**
- **Disappearing disk causes tool to hang**
- **No errors are ever reported (read, write or invalid data)**

Prompt:

Add the ability to write and verify more than 1 disk at a time. All disks should be accessed in parallel.

Reintroduced Errors

- **Unterminated string**
- **Missing “#!” on first line**
- **Tool does not accept multiple disks**

Final Output:

A screenshot of a macOS terminal window. The title bar at the top shows three colored window control buttons (red, yellow, green) followed by a folder icon and the text "Claude — -zsh — 85x10". The terminal area has a dark blue background. The prompt "standing@Fika Claude %" is shown in green text. The command "sudo ./cert_disk /dev/rdisk4 /dev/rdisk5 /dev/rdisk6" is entered in green text, followed by a white cursor. A small menu icon is visible in the top right corner of the terminal window.

```
standing@Fika Claude % sudo ./cert_disk /dev/rdisk4 /dev/rdisk5 /dev/rdisk6
```

Problem with resetting terminal:

A terminal window titled 'CertifyDisks — Python ◀ sudo — 85x14' displays the output of a disk write test. The output is formatted with green text on a dark background, featuring horizontal lines of equals signs to separate sections. The test results show three disks (rdisk4, rdisk5, rdisk6) each at 3.0% to 3.1% completion with speeds around 650-660 MB/s. The overall combined speed is 1974.8 MB/s for a total of 2682.8 GB of data. A cursor is visible at the bottom left of the terminal area.

```
=====
PARALLEL DISK WRITE - 3 DISKS
=====
Disk 0 (rdisk4   ):  3.0% (894.3GB)  651.8 MB/s
Disk 1 (rdisk5   ):  3.0% (894.3GB)  655.2 MB/s
Disk 2 (rdisk6   ):  3.1% (894.3GB)  667.7 MB/s
=====
Overall:   3.1% Complete | Combined Speed: 1974.8 MB/s
Total Data: 2682.8 GB
█
```

Reset terminal:

`print(f"\033[2J\033[H")`

Move cursor:

`print(f"\033[{lines_to_move}A", end="")`

Problems with AI generated code

- **Uses Terminal reset**
- **Gigantic i/o size - 256 MB**
- **i/o continues after tool is terminated**
- **Command line parser does not work**
- **Disappearing disk causes tool to hang**
- **No errors are ever reported (read, write or invalid data)**

of code to be AI-
generated in the
next five years.**

20VC Podcast (March 31, 2025)

20VC

<https://www.youtube.com/watch?v=KN7KYzpPfiU>

20VC Podcast (March 31, 2025)

<https://www.youtube.com/watch?v=KN7KYzpPfiU>

Steps for creating code:

- 1) Create main() and check input parameters
- 2) Create Disk class and provide __init__ function
- 3) Add write_pattern() method to Disk class
- 4) Add read_pattern() method to Disk class
- 5) Add test_disk() method to Disk class
- 6) Create a separate thread for each Disk object
- 7) Monitor progress of each Disk object

Steps for creating code:

- 0) Give Claude an background and an objective**
- 1) Create main() and check input parameters**
- 2) Create Disk class and provide __init__ function**
- 3) Add write_pattern() method to Disk class**
- 4) Add read_pattern() method to Disk class**
- 5) Add test_disk() method to Disk class**
- 6) Create a separate thread for each Disk object**
- 7) Monitor progress of each Disk object**

Prompt: Step 0 - background and an objective)

We are writing a Python 3 script, called "cert_disk", which will write out a pattern to every sector of a disk and then reach back each sector and make sure the pattern is correct. It will take as parameters one or more bsd disk names.

This script will be used by test engineers and must have detailed progress information and error messages. It will be invoked in a Terminal window on macOS by just calling the command, e.g. "cert_disk disk1".

Do not add any code to this script until I ask you to do so.

Prompt: Step 1 - create main(), check parameters

Create a python script which accepts 1 or more parameters which are bsd disk names as strings which either start with "disk" or "/dev/rdisk". If any of the input parameters don't start with these strings, print out an error message and exit with an error.

Prompt: Step 1 - create main(), check parameters

Create a list of disk strings. If the parameter starts with "disk" add it to a list. If it starts with "/dev/rdisk" remove the "/dev/r" from the beginning of the string and then add the substring to the list.

Prompt: Step 1 - create main(), check parameters

Check that the script is being run with root privileges. If not, print out an error message and exit with an error.

Output:

A terminal window with a title bar containing three colored circles (red, yellow, green) and a folder icon, followed by the text "Claude_Take_2 — -zsh — 85x7". The terminal content shows a command being executed and its output.

```
[standing@Fika Claude_Take_2 % sudo ./cert_disk_prompt_1 disk4 /dev/rdisk6  
cert_disk: Validating 2 disk name(s)...  
cert_disk: All disk names validated successfully  
  - disk4  
  - /dev/rdisk6  
cert_disk: Disk certification logic not yet implemented
```

Prompt: Step 2 - create Disk class

Create a class called Disk. The `__init__` function should take the bsd disk name string similar to "disk1".

The `__init__` function should create a 16 megabyte (MiB) block of random data as a data member for each Disk object.

The `__init__` method should store the string in a data member called description.

Prompt: Step 2 - create Disk class

Add a disk_description method to the Disk class which returns the description data member.

Prompt: Step 2 - create Disk class

Add a `get_size` method to the Disk class which gets the size of the disk. This should use the `DKIOCGETBLOCKSIZE` and `DKIOCGETBLOCKCOUNT` options with the `fcntl.ioctl` call to retrieve the disk block size and disk block count and return the product of these two.

If there is an error or if the disk does not exist, the method should return 0.

Output: Step 2 - create Disk class

```
standing@Fika Desktop % sudo ./cert_disk disk4 disk5 /dev/rdisk6
```

A terminal window titled "Desktop — -zsh — 85x20" is shown. The window has a dark blue background. The command "sudo ./cert_disk disk4 disk5 /dev/rdisk6" is entered in green text. The prompt "standing@Fika Desktop %" is visible. The window has standard macOS window controls (red, yellow, green buttons) and a title bar. A small icon of a person is visible in the top left corner of the terminal area.

```
8
9 class Disk:
10     """
11     Represents a disk device for certification testing
12     """
13
14     def __init__(self, disk_name):
15         """
16         Initialize a Disk object
17
18         Args:
19             disk_name: BSD disk name string (e.g., "disk1", "/dev/rdisk1")
20         """
21         self.description = disk_name
22
23         # Create 16 MiB (16 * 1024 * 1024 bytes) of random data
24         random_data_size = 16 * 1024 * 1024 # 16 MiB
25         self.random_data = bytearray(random_data_size)
26
27         # Fill the buffer with random bytes
28         for i in range(random_data_size):
29             self.random_data[i] = random.randint(0, 255)
30
```

Fix: Step 2 - create Disk class

Find a faster way to fill the random_data buffer with random data (lines 28 and 29). It doesn't have to be truly random just has to be unique to each Disk object.

Output - Fixed: Step 2 - create Disk class:

A terminal window with a title bar that reads "Desktop — Python < sudo — 85x20". The terminal content shows a command being executed: "[standing@Fika Desktop % sudo ./cert_disk disk4 disk5 /dev/rdisk6]". The prompt is in green, and the command is in white. A cursor is visible on the line below the command.

```
[standing@Fika Desktop % sudo ./cert_disk disk4 disk5 /dev/rdisk6]
```

Prompt: Step 3 - add write_pattern() to Disk class:

Add a write_pattern method to the Disk class. This method has no return value. When this method is called, the bsd disk is opened and the disk is written to in 16 megabyte (MiB) blocks. Once all of sectors on the disk have been written to, the bsd disk is closed.

If there is an error when writing to the disk, the write_pattern method returns immediately.

Prompt: Step 3 - add write_pattern() to Disk class

Add three data members to each Disk object: `byte_offset` and `command_successful` and `command_complete`.

The `byte_offset` data member stores the byte offset for the start of the next write operation. The `command_successful` data member is a boolean which is set to true after every write command completes successfully. If the write command completes with an error, it is set to false. The `command_complete` data member is a boolean which is set to false when the `write_pattern` method is first called and set to true just before it returns.

Add methods called `current_offset`, `current_command_successful` and `current_command_complete`, which returns values of the `byte_offset`, `command_successful` and `command_complete` respectively.

Prompt: Step 3 - add write_pattern() to Disk class

Add code to the `__init__` method to set the `current_offset` to 0, the `command_successful` to True and the `command_complete` to False.

Prompt: Step 3 - add write_pattern() to Disk class

Add a global boolean variable to the script called gTestMode. Add code to the write_pattern method of the disk class so that it only writes to the first 1 gigabyte (GiB) of the disk if the boolean is true.

Prompt: Step 3 - add write_pattern() to Disk class

Add code to the main function to iterate through each of the Disk objects and call write_pattern on each one.

Prompt: Step 3 - add write_pattern() to Disk class

Add code to the main function so it uses the values from the disk_description, current_offset, current_command_successful methods to print out the bsd disk name and total number of bytes written and whether there was an error after calling the write_pattern method for each Disk object.

Output: Step 3 - add write_pattern() to Disk class

A terminal window with a title bar that reads "Claude — -zsh — 85x20". The window contains a single line of green text: "standing@Fika Claude % sudo ./cert_disk disk4 disk5 disk6". The cursor is at the end of the command.

```
standing@Fika Claude % sudo ./cert_disk disk4 disk5 disk6
```

Prompt: Step 4 - add read_pattern() to Disk class

Add a read_pattern method to the Disk class. This method has no return value. When this method is called, the bsd disk is opened and the disk is read in 16 megabyte (MiB) blocks.

After each read completes, the 16 MiB of data is compared to the buffer in the Disk object to make sure it is identical.

Once all of sectors on the disk have been read, the bsd disk is closed. If there is an error when reading to the disk or the pattern is not identical to the one written out, the read_pattern method returns immediately.

Prompt: Step 5 - add test_disk() to Disk class

Add a test_disk method to the Disk class. When called, this method first calls the write_pattern method.

When write_pattern returns, it checks the value of the command_successful data member and calls read_pattern if the value is True.

Otherwise, test_disk just returns.

Prompt: Step 5 - add test_disk() to Disk class

Add a boolean data member called writing to the Disk class.

Add a currently_writing method to the Disk class which returns this value.

Add code to the `__init__` function to set the writing data member to False.

Prompt: Step 5 - add test_disk() to Disk class

Change the main function so that it no longer calls write_pattern and read_pattern on each Disk object. Instead it calls test_disk on each Disk object.

It should then use the values from the disk_description, current_offset, current_command_successful methods to print out the bsd disk name and total number of bytes written and whether there was an error after calling the test_disk method for each Disk object.

Output: Step 5 - add test_disk() to Disk class

A terminal window with a title bar that reads "Desktop — -zsh — 86x16". The window contains a single line of green text: "standing@Fika Desktop % sudo ./cert_disk disk4 disk5 /dev/rdisk6". The text is followed by a grey cursor block.

```
standing@Fika Desktop % sudo ./cert_disk disk4 disk5 /dev/rdisk6
```

Prompt: Step 6 - create a thread for each Disk object

Change the main function so that it creates a separate thread for each Disk object in the list. This thread should call test_disk.

Prompt: Step 7 - monitor progress of each Disk object

Add code to the main function so that every 10 seconds it prints a line with the number of seconds since the script has started. It should then go to the next line and print out a status line for each Disk object.

Each status line should include the bsd disk name, the current offset, whether the Disk object is reading, writing or completed, whether the last completed successfully.

Output: Step 7 - monitor progress of each Disk object

A terminal window with a title bar that reads "Claude — -zsh — 85x10". The window contains a single line of green text: "standing@Fika Claude % sudo ./cert_disk disk4 disk5 disk6". The text is followed by a grey cursor block. The terminal background is dark blue-grey.

```
standing@Fika Claude % sudo ./cert_disk disk4 disk5 disk6
```

Final Output:

Functionality of final tool

Reports error on:	Passive Person with AI	Active Person with AI
Disk disappears	✗	✓
Write error	✗	✓
Read error	✗	✓
Data corruption	✓	✓

Time to create final tool

	No AI	Passive Person with AI	Active Person with AI
Time to Create Prompt		1 minute	1.5 hours
Time with Agent		2 hours	1.5 hours
Time to Manually Debug		6 hours	0 hours
Total Time	12 - 15 hours	8 hours	3 hours

Recommendations

- **Use AI as a tool not a solution**
- **Start with a context prompt**
- **Do your own design and describe it in your prompts**
- **Don't argue with AI**

Is AI in your future?
